Date: 30th September 2026

1. Executive Summary

Cute Tower Climber is a turn-based RPG game. The player must climb through floors of a tower. On each floor the player faces enemies, improves character stats, learns skills and creates different strategies for every battle.

The main goal of the game is to offer an engaging RPG experience. The player makes choices about how to grow their character and how to fight. There are character types to choose from. The player can upgrade stats, unlock new skills and change tactics based on play style.

The tower is the way the game progresses. Each time the player defeats enemies and clears a floor they unlock chances and tougher challenges. Every ten floors there is a boss enemy which serves as a major progression point.

2. Game Concept

Cute Tower Climber's idea of climbing a fantasy tower filled with enemies and increasing difficulty. Each floor represents a new challenge, and players must defeat the enemies on that floor before moving forward.

The player can choose between five playable classes: Knight, Berserker, Assassin, Mage, and priest. Each class has its own strengths, passive abilities, and available skills.

The Knight focuses on durability and defensive abilities. The Berserker focuses on aggressive attacks and life-stealing abilities. The Assassin has a higher chance of dealing critical damage. The Mage specializes in applying negative effects to enemies. The priest uses healing abilities and can also gain offensive benefits from having high maximum health.

Players are not permanently locked into one class. They can change classes outside of combat and experiment with different strategies before entering a tower floor.

The game is divided into several main interfaces, including the Home Screen, Character and Skill Management Screen, Tower Selection Screen, and Battle Screen. These screens allow the player to manage progression and prepare before each battle.

3. Game Objectives

The primary objective of Cute Tower Climber is to climb as high as possible in the tower by defeating the enemies found on each floor.

Players must continuously improve their characters by earning Gold and spending it on statistic upgrades and skills. The main character statistics are HP, ATK, and DEF.

Another objective is to encourage players to experiment with different classes and skill combinations. Certain difficulties may be easier to defeat with specific strategies, which allows players to adapt their approach instead of relying on the same actions throughout the entire game.

Boss battles appear every ten floors and act as main challenges that test how effectively the player has built their character and prepared their skills.

4. Game Creativity & Design

The concept was based on a chibi style with chibi character and soft visual elements. Although the game includes combat and enemies, the overall presentation remains colorful and friendly.

The interface of every screen has a clear purpose. The Character Screen allows players to view and improve their statistics. The Skill Screen allows players to change and equip abilities. The Tower Screen shows available floors and progression. The Battle Screen contains the information and actions required during combat.

One of the main design ideas is the shared progression system between classes. Players do not need to create and level a separate character for every class. Basic progression is shared, while each class provides different skills and passive abilities.

The game also adds strategic flexibility through skill selection. Players can own multiple skills but can only equip four skills before entering combat. This creates a preparation phase where the player must decide which abilities will be most useful for the upcoming battle.

5. Gameplay
The gameplay starts with the player selecting a character class and preparing their character before entering the tower.

Before starting a battle, players can check their statistics, purchase upgrades, select skills, and change classes.

After entering the battle screen. Combat follows a turn-based structure where the player acts first and then the enemy responds.

A typical combat round follows this sequence:

Player Turn – The player chooses either a normal attack or one of the equipped skills.

Calculation – The game calculates damage, healing, buffs, debuffs, critical attacks, and passive effects.

Enemy Turn – The enemy performs an attack or ability against the player.

End of Turn – The game updates cooldowns, temporary effects, buffs, debuffs, and other turn-based conditions.

The battle continues until either the player's HP or the enemy's HP reaches zero.

If the player defeats the enemy, they receive rewards and may unlock the next floor. If the player loses, they can return to the preparation screens, improve their character, change classes, modify their equipped skills, and attempt the floor again.

6. Game Mechanics
The main statistics in Cute Tower Climber are HP, ATK, and DEF. HP represents the amount of damage a character can receive before being defeated. ATK determines the base damage dealt by attacks and skills. DEF reduces the damage received from enemies. Players can use Gold to upgrade these statistics. Every successful HP, ATK, or DEF upgrade increases the player's Level by one.

The game also has an Undo system for statistic upgrades. Players can reverse their upgrade and receive back the exact amount of Gold that was spent.

Each character class also has a passive ability. For example, the Berserker can recover HP through lifesteal, the Assassin receives an increased critical chance, and the Mage has a chance to apply powerful negative effects to enemies. Passive abilities can become stronger as the player's Level increases.

A character can equip up to four skills before entering battle. Each skill has different effects and cooldowns. Some skills focus on damage, while others provide healing, defensive bonuses, status effects, shields, or other special abilities. Because powerful skills cannot be used continuously, players must consider when to use each ability during combat.

7. Tech: PowerApps

Cute Tower Climber is developed using Microsoft Power Apps, with Canvas App serving as the primary development environment.

Canvas App allows developers to manually design screen layouts, buttons, character interfaces, health displays, tower menus, and other visual elements required for the game.

8. Conclusion

Cute Tower Climber is a turn-based RPG focused on tower progression, character development, class selection, and strategic skill usage. Players upgrade their characters while facing increasingly difficult enemies and bosses. The game mechanics provide several ways for players to adjust their strategy. The game using cute visual design, Using Microsoft Power Apps as the development platform

The final goal of the project is to create a functional game prototype where players can select a class, improve their character, equip skills, enter battles, earn rewards, and continue climbing through the tower as part of a complete gameplay loop.
